

Minutes of The Tenth Meeting

OS1 group B

22th May 2025

Chair Orvila Sarker

Secretary Xin Wei

Members Cong Deng

Tianhua Zhang

Sheng Wang

Yifan Gu

Apologies None.

1. Time and Place

The tenth team meeting for the MCI OS1 project was held online on **22th May** at **11:00 AM**.

2. Quorum Announcement

The chairperson announced that a quorum was present, and the meeting commenced formally.

3. Summary of Previous Meeting

The team advanced the test plan based on prior feedback, completing preliminary designs for model testing and interface testing. This meeting focused on optimizing test plan details and document specifications.

4. Group Milestone

4.1. Overview

The team completed a draft of the test plan and discussed format and content details, clarifying subsequent revision directions.

4.2. Key Points for Test Plan Optimization

- Document Format
 - Issues: Excessive line spacing in appendices, cross-page content in some sections (e.g., Section 4.2), and ambiguous terminology (e.g., "support category").
 - Optimization Requirements: Adjust formatting, add page numbers; change "expected outcomes" to "outcomes" to distinguish between completed and planned tests.
- Model Testing Details
 - LDA Model: Clarify that "numerical verification" refers to coherence score calculation (using libraries like gensim), with a threshold >0.4 for interpretable topics.
 - Similarity Testing:
 - Phase 1: Generate paraphrased questions using the Llama model (100 security software-related data points labeled by ChatGPT).
 - Phase 2: Test matching accuracy using models like cosine similarity; supplement model names and hyperparameters (e.g., sentence embedding models).
 - Data Presentation: Propose using tables to show "first-position matching rate," "second-position matching rate," and "processing time," with appendix explanations of "position score" calculation logic.

- Interface and Interaction Testing
 - Tools: Cypress, Chrome DevTools.
 - Test Points: Navigation flow, input response time (e.g., search button click to result return $\leq 100\text{ms}$), and interface compatibility (breakpoint testing).
 - Requirements: Cite industry standards and define "correct response" (e.g., relevant answers returned after text input and search).

4.3. Code and Data Specifications

- Code Management: Upload test code to GitHub; reference links in reports and describe implementation logic (e.g., libraries, hyperparameters).
- Data Presentation: Avoid raw data dumping in appendices; use sample tables to show key results (e.g., similarity scores) and reference additional data via links.

5. Submission

Revised test plan document (including format adjustments and indicator supplements).

6. Next Steps

6.1. Document Revision

- Adjust appendix formatting (line spacing, terminology consistency) and add page numbers.
- Supplement model details, indicator definitions, and industry standard citations in each test section.
- Update the test schedule with a "Status" column (e.g., "Completed," "In Progress").

6.2. Technical Validation

- Implement tabular display of similarity analysis results (e.g., matching rate comparisons across models).
- Supplement specific execution steps and expected results for user interface tests (e.g., button interaction test cases).

7. Adjournment

The next team meeting is scheduled for **29th May** at **11:00 AM**.
